Tutorials for backuping How to backup Mac using TimeMachine: How to Backup Mac using Google Drive: How to Backup External Hard Drive using Windows: How to Backup External Hard Drive using Mac: Potential treatment for atrial fibrillation by controlling atrial substrate. The heart consists of multiple electromechanical and electrical circuits, and there are numerous ways for the electrical circuits to be inactivated. It has long been known that atrial fibrillation (AF) can be induced by high-frequency electrical stimulation in the presence of certain atrial triggers, and this concept has been called the "electrical trigger" theory. However, whether electrical triggers exist in atria during AF has not been resolved. Animal experiments and human studies have not found an AF trigger (sinoatrial node- or atrial-triggered AF) in the absence of triggers outside the heart. It is becoming increasingly evident that the "electrical trigger" theory is not correct and that AF is triggered by changes in the electrical activity and other biological factors rather than by changes in the cardiac pacemaker (sinoatrial node). Most types of AF, including atrial flutter and the various reentrant wavefronts, can be terminated by modification of the atrial substrate, by drugs, or by electrical/mechanical modifications of the atria. Targeting AF by modulating atrial substrate is a viable treatment strategy. In this article, we discuss the electrophysiological properties of the atrial substrate, methods of experimental AF induction and maintenance, various AF mechanisms, and the electrophysiological basis of AF, and we review the potential of antico
